RGB-D CAMERA -BODY TRACKING

Corso Realtà Virtuale 2024/2025

eleonora.chitti@unimi.it

RGB-D CAMERA

DEPTH CAMERA

- What is a depth camera?
 - The depth camera provides information on the *distance* (Z) dimension in addition to traditional RGB images.
 - It means that they are able to detect the distance between the camera itself and a subject.

Depth cameras are also called RGB-D cameras or 3D cameras.

- Factors that affect the Depth data quality:
 - Lighting
 - Distance
 - Different materials or Shapes
- Different types of depth cameras are available, as the Kinect (1, 2, Azure), Orbbec Astra and RealSense; recently also some smartphone have a depth camera.

KINECT

The First version of Kinect was released in 2010 as a controller for Xbox 360, the second version was released in 2013 for Xbox One, primarily for gaming purposes.

It allows to track user's movements with the device's SDKs, and it has been widely used in the exergames research domain, since it was one of the first devices at accessible prices to support body tracking.

Kinect I and 2 are no more supported by Microsoft and now the new Kinect Azure has been released, that is connected to the Azure AI services.

https://azure.microsoft.com/en-us/services/kinect-dk/#overview

Image from https://docs.microsoft.com/en-us/azure/kinect-dk/hardware-specification

REALSENSE D435

The Inter released the RealSense D435 in 2018 as a part of the D400 series.

It has been exploited on robotic platforms and drones, since it is particularly small (9cm \times 2,5 cm) and with reduced weight.

It has custom SDK that supports different platforms and languages (python, node.js, c# ...) and it supports also Unity3D and Unreal, <u>https://www.intelrealsense.com/developers/</u>

LIDAR AND TRUE DEPTH

 LiDAR stands for Light Detection and Ranging. This technology uses the pulse from a laser to detect the environment and perform calculations used to create 3D models and maps of objects and environments.

https://geoslam.com/what-is-lidar/

 The True Depth camera is a depth camera included in the front camera of iPhone to perform Face Detection, ARKit library includes supports for depth face's data management.

BODY TRACKING FROM 3D STREAM

BODY TRACKING

- What is a body tracking?
 - As the term indicates, it represents the tracking of position and movements of user's body, and a joints model (keypoints) of the body is exploited for the representation.

BODY TRACKING: NUITRACK

NUITRACK: https://nuitrack.com

It is a 3D tracking middleware for skeleton tracking and gesture recognition for Android, Windows, and Linux. It aims to establish an API for communication with 3D sensors. (On license)

It supports also Unity with a unitypackage.

GitHub link:

https://github.com/3DiVi/nuitrack-sdk

BODY TRACKING FROM 2D STREAM

BODY TRACKING: OPENPOSE

OpenPose: <u>https://arxiv.org/pdf/1812.08008.pdf</u>

It is a real-time multi-person system to jointly detect human body, hand, facial, and foot keypoints (in total 135 keypoints) on single images. It offers 2D pose estimation and 3D pose reconstruction and estimation.

It supports also Unity with a specific plugin.

GitHub link:

https://github.com/CMU-Perceptual-Computing-Lab/openpose

BODY TRACKING: GOOGLE AI

Google AI : <u>https://developers.google.com/ml-kit/vision/pose-detection</u>

It is a real-time multi-person system to detect the pose of a subject's body in real time from a continuous video or static image. It offers 2D pose estimation, the Z is an experimental value calculated in image pixels indicating the distance of the hips from the camera.

ONE EXERCISE IN TWO VERSIONS (MACOS AND WINDOWS)

PRELIMINARY STEP: IMPORT RIGGED CHARACTER IN UNITY

UNITY ANIMATION AND RIGGING

- A rig consists in a series of joints mimicking human bones; the character's mesh is connected to the bones (with the weight paint) and moves together with them.
- In Unity the rigged and skin properties need to be setup properly when importing an FBX cheater rigged with a tool as Blender or Maya.

DOWNLOAD A MIXAMO RIGGED CHARACTER

Adobe Mixamo offers different rigged avatars and different human animations, that you can download as FBX file.

You can download a Mixamo rigged character FBX file from:

https://www.mixamo.com

N.B: user free subscription is required to download characters and animations.

CHARACTER'S SETUP

- I. Import the FBX by dragging it into the Project Window of the Unity Project
- 2. Select it
- 3. In the Inspector panel, click on the Model tab and uncheck the Import camera and Import light (we didn't exported the camera and light in our FBX) optional , you can skip this step–
- 4. If you have performed the step 3 then click on "Apply" button

OPTIONAL (STEPS 3,4)

Rigging_basic_anim Ir	mport Settings	1
Model Rig	g Animation Materials	
Scene		
Scale Factor	1	
Convert Units	 1cm (File) to 0.01m (Unity) 	
Bake Axis Conversion		
Import BlendShapes	\checkmark	
Import Visibility		
Import Cameras		
Import Lights		
Preserve Hierarchy		
Sort Hierarchy By Name	\checkmark	
Meshes		
Mesh Compression	Off	
Read/Write Enabled		
Optimize Mesh	Everything	
Generate Colliders		
Geometry		
Keep Quads		
Weld Vertices		
Index Format	Auto	
Legacy Blend Shape Norma		
Normals	Import	<u> </u>
Blend Shape Normals	Calculate	r
Normals Mode	Area And Angle Weighted	r
Smoothness Source	Prefer Smoothing Groups	r
Smoothing Angle	• 60	
Tangents	Calculate Mikktspace	

Scroll down to find the Apply button

CHARACTER'S SETUP

- 5. Now click on Rig
- 6. Change the **Animation Type** to **Humanoid**
- 7. Change Avatar Definition to Create from this model
- 8. Apply

Inspector					a :				
Rigging_ba	asic_ani	m Imp	oort Setting	s	0 ∓ :				
l.					Open				
	Model	Rig	Animation	Materials					
Animation Type		F	lumanoid		•				
Avatar Definition Crea			reate From This Model 🔹						
					 Configure 				
Skin Weights		S	tandard (4 B	ones)	•				
Optimize Game (
					Revert Apply				
Imported Object									

CHARACTER'S SETUP

MIXAMO CHARACTERS (AND UNITY)

If the Mixamo avatar into your Unity Project **has not the Materials** you can export them by:

- I. Click on Textures: "Extract Textures"
- 2. If a popup appears confirm with "fix it"

Otherwise, if the first method is not working:

- I. click on Materials
- choose the option: Location -> Use External Materials (Legacy)
- 3. Click on **Apply**

https://forum.unity.com/threads/mixamo-unity-does-notimport-any-textures.516301/

NUITRACK EXERCISE (WINDOWS ONLY)

NUITRACK BODY TRACKING EXERCISE

If you have an RGB-D camera, you can develop in Unity with NUITRACK:

I. Install nuitrack into you Windows PC:

https://github.com/3DiVi/nuitrack-sdk/raw/master/Platforms/nuitrack-windowsx64.exe

2. Setup the Unity project following the documentation here (OPTIONAL- we deepen the Unity package installation guide in the next slide):

https://github.com/3DiVi/nuitrack-sdk/blob/master/doc/Unity_Basic.md

NUITRACK BODY TRACKING EXERCISE

NUITRACK:

- You can download the NuiTrack Unitypackage from the latest release in the GitHub page (for activation you need a trial licence): <u>https://github.com/3DiVi/nuitrack-sdk/</u>
- Create a new project in Unity (2020.3.1 or later recommended I will use Unity 2021.3.17)
- In the project go to Assets -> Import Custom Package > select NuiTrack unitypackage
- Connect supported sensor
- In the top menu, select "Nuitrack/Activate Nuitrack"
- In the top menu, select "Nuitrack/Play Test Unity Scene" (or manually open in Project Tab "Assets/NuitrackSDK/NuitrackDemos/AllModulesScene" and click Play button) (If something doesn't work, follow the on-screen instructions)

NUITRACK BODY TRACKING 2 EXERCISES

- Open Assets/NuitrackSDK/Tutorials/First Project
- Open NativeAvatar/TranslationAvatar.cs
- In the Update() function:
 - CurrentUserTracker has a static variable CurrentSkeleton
 - CurrentSkeleton is updated every frame, and it contains the information about the posture of the player
- Run in editor
- Open Assets/NuitrackSDK/Tutorials/Avatar Animation/Scenes/RiggedModel.scene and look at:
 - NuitrackScripts -> Nuitrack Manager.cs
 - RiggedAvatar -> RiggedAvatar.cs
- Run in the editor

(OPTIONAL) UNITY AND ARKIT EXERCISE (IOS - MAC ONLY)

AR BODY TRACKING WITH ARKIT (MACOS ONLY)

- ARKIT Body Tracking device requirements:
 - IOS 13.0+ or IPADOS 13.0+
 - device with A12 chip or later (iphone XR, XS, 11, SE2020 and next generations)

SETUP PROJECT

I. Import ARFoundation from the Package Manager (see slides from the previous laboratory)

- 2. Create an Empty Unity scene:
 - Add ARSession
 - Add XR Origin (Mobile)

HUMAN BODY TRACKING

- I. Click on the XR Origin (Mobile):
- 2. In the Inspector click Add Component then write AR Human Body Manager and select it
- 3. Uncheck "Pose 2D" and "Pose 3D Scale Estimation"
- 4. Check "Pose 3D"
- 5. Add the avatar prefab into the human body prefab

= 1 Transform			_		_		ച	-+	:
					_	_	ø	-i-	•

(OPTIONAL) ADDITIONAL INFO

REALSENSE WITH UNITY (WINDOWS ONLY)

- You can download the SDK 2.0 here: https://www.intelrealsense.com/developers/
- Then you can download the Unitypackage: <u>https://github.com/IntelRealSense/librealsense/releases</u>
- Import the package in a new Unity Project (previously check current Unity supported versions!)

AR BODY TRACKING WITH ARKIT (MACOS ONLY)

 ARKIT in Xcode with Swift: <u>https://developer.apple.com/documentation/arkit/content_anchors/capturing_bo</u> <u>dy_motion_in_3d</u>

 ARFOUNDATION with Unity: <u>https://github.com/Unity-Technologies/arfoundation-</u> <u>samples/tree/main/Assets/Scenes/HumanTracking</u>

LIDAR + ARKIT WITH SWIFT (MACOS ONLY)

 You can download the ARKit example here <u>https://developer.apple.com/documentation/arkit/content_anchors/visualizing_and_interacting_and_interacting_with_a_reconstructed_scene</u>

Lidar + unity: <u>https://forum.unity.com/threads/ar-foundation-support-for-iphone-12-pro-with-lidar.987810/</u>

https://github.com/Unity-Technologies/arfoundation-samples/tree/main/Assets/Scenes/ARKit
